

Dental Implants

Dental Implants offer a permanent solution to your missing teeth. They are ideal for replacing missing teeth, and stabilising dentures.

A dental implant is typically a small screw shaped attachment usually made from titanium. It is inserted within the jawbone to take the place of a missing tooth root. Once osseointegration (when the bone firmly attaches to the implant) has occurred, a replacement tooth can be secured to the top of the implant. The new tooth can look, feel and perform just like a natural tooth. It is possible to use multiple implants to support a denture or bridge.

What are the Benefits of Dental Implants?

1. Implant secured or stabilised replacement teeth are more comfortable than conventional dentures because there is no slipping or movement. This eliminates some of the key worries of dentures and improves self confidence.
2. Implants are an alternative to bridgework for permanently replacing missing teeth, eliminating the need to grind down healthy teeth.
3. When teeth are lost the bone around the teeth gradually dissolves away. Dental implants offers a solution to help prevent this bone loss and the risk of looking prematurely aged.
